Sprint 2 — 10 work items, 35 story points.

Burndown Charts

Sprint 1 Burndown Chart — 21 story points.

Sprint 2 Burndown Chart — 35 story points.

Reflection Questions

1. Did your estimations reflect the actual effort?

Yes. The story point estimates represented the relative effort and complexity of the warehouse inventory, pallet tracking, stock movement, and reporting tasks. The completed sprints showed that the planned estimates were workable for the simulation.

2. Was your backlog well-prioritized?

The backlog was organized around four functional epics and the user stories were divided into two manageable sprints. Core inventory and location/stock movement functions were included first, followed by monitoring and reporting functions.

3. How did your simulated sprint align with your plan?

The simulation aligned with the plan. Sprint 1 contained 5 stories worth 21 points and Sprint 2 contained 10 stories worth 35 points. The planned stories were moved through the Scrum workflow and completed.

4. What insights did the burndown chart give about your team's capacity?

The burndown charts showed the remaining story points reaching zero for the completed sprints. Because multiple stories were completed together during the simulation, the remaining-work line dropped sharply rather than gradually. The two sprints demonstrated a total simulated capacity of 56 story points.
